GhostLedger

Strategic Foundation

Financial accountability infrastructure.

February 2026

What GhostLedger Is

GhostLedger is financial accountability infrastructure. It treats unpaid money, withheld payouts, and unresolved financial obligations as verifiable financial objects — not support tickets.

GhostLedger records claims, tracks execution, and preserves outcomes in a way that cannot be ignored, quietly erased, or endlessly deferred.

It is designed to operate in conflict, persist through bear markets, and produce permanent records of what was owed, what was attempted, and what was resolved.

GhostLedger does not speculate. It settles.

Core Functions

- Track financial obligations (wages, payouts, grants, platform balances)
- Create verifiable, timestamped claims
- Apply escalation logic when resolution stalls
- Route recovered funds automatically
- Produce execution records that become financial reputation data

Why Solana

- Low fees make micro-claims viable
- Speed enables real-time case state updates
- Cheap storage supports long-lived financial records
- Non-speculative transaction volume aligned with network sustainability

LITMUS Alignment

GhostLedger is designed to survive the LITMUS test — a financial reality standard that separates infrastructure from narrative.

L — Lives in bear markets

Unpaid money does not disappear when prices fall. Recovery demand is counter-cyclical.

I — Independent of speculation

No token dependency. No yield promises. Revenue from resolution fees.

T — Tolerates conflict

Built for disputes, not cooperation. The system functions precisely when parties disagree.

M — Measures execution, not promises

Every claim, attempt, and outcome is recorded. Execution Score derived from real actions.

U — Uncomfortable transparency

Records are permanent and immutable. Outcomes cannot be quietly erased.

S — Settles real-world consequences

Funds are actually recovered and routed. This is not a simulation.

Structural Principles

Separation of Concerns

- GhostLedger = the system (neutral infrastructure)
- LITMUS = the standard (editorial lens)
- Backpack Capital = the deployment arm (future)

Governance

- Process, not personality
- Documentation supremacy
- No single point of failure
- Designed for durability under pressure
- Escalation paths are procedural, not discretionary

Public Posture

- Facts, not accusations
- Records, not arguments
- Persistence, not persuasion
- Let systems fail on their own record
